

Road Safety Progress Report

A quarterly report of road crashes in South Australia - March 2010

The 125 fatalities reported for the 12 months to the end of March 2010 were 6 more than the 119 fatalities recorded January to December 2009. Overall crashes and casualties in the last 5 years have continued decreasing. In recent years, serious injuries are also decreasing in number. In 2009 serious injuries decreased to 1101, the lowest number on record.

The South Australian State Strategic Plan has a target to reduce fatalities to less than 90 persons per year and serious injuries to less than 1000 per year by 2010.

South Australian road fatalities and serious injuries – progression towards the target:

	2003	2008	2010 current figure	2010 Target
Fatalities	156	99	125 (12 months to March 2010)	less than 90
Serious injuries	1468	1218	1101 (12 months to December 09)	less than 1000

There were 125 fatalities for the 12 months to the end of March 2010 compared to 119 last quarter (12 months to the end of December 2009). There were 1101 serious injuries for the 12 months to the end of December 2009 compared to 1102 serious injuries for the previous quarter (12 months to the end of September 2009).

Fatalities

National Comparison

The following graph compares the fatality rate per 100,000 population for the 12 months to the end of March 2010 compared to the previous 12 months for all States and Territories of Australia. Fatality numbers are from the Australian Department of Infrastructure, Transport Regional Development and Local Government's latest release '*Road Deaths Australia, Monthly Bulletin March 2010*'¹.

South Australia continues to perform well. As of March 2010 South Australia has achieved the greatest average annual percentage change of any state in Australia since 2005 – a 4.4% decrease, compared to states such as NSW with a 3.3% decrease, Victoria 3.8% decrease, Qld which has had a 0.5% decrease and WA a 1.9% increase.

Figure 1 – Fatalities per 100,000 population by State and Territory, Australia

¹ Fatality numbers from the Department of Infrastructure, Transport, Regional Development and Local Government '*Road Deaths Australia, Monthly Bulletin, March 2010*'.

Fatalities

Trend in South Australia

Fatalities have decreased in recent years. In 2008 the number of fatalities was below 100 for the first time in over 60 years, reaching a total of just 99. May 2009 and January 2010 had high monthly totals. This has brought the 12 month fatality total to the end of March 2010 to 125.

Annual Road Deaths:

Target 2010: 90

2003: 156

2008: 99

(12 month to the end of Mar.) 2010: 125

The 125 fatalities recorded for the 12 months to the end of March 2010 is 39% above the 2010 target of less than 90. The general decline in the number of fatalities in South Australia has been achieved despite a steadily rising population and an escalation in the number of motor vehicles on register. From the current trend, the number of fatalities will reach approximately 102 by 2010.

Figure 2 – Number of fatalities in South Australia (rolling 12 monthly data)

Note: Each point represents the number of fatalities in the preceding 12 months.

Fatalities by road user type:

	April 09-March 10	2004-2008	Difference
Drivers	65	63	+2
Passengers	32	28	+4
Motorcyclists	18	18	-
Cyclists	3	3	-
Pedestrians	7	12	-5
Motorised wheelchair	-	1	-
Total	125	125	-

Serious injuries

Trend in South Australia

Since 2000 serious injuries have decreased each year except in 2006 and 2007 when they once again increased. In 2009 the total reached 1101, the lowest yearly total of serious injuries since systematic recording began in 1968. This is just 10% above the 2010 target. The current trend shows that serious injuries will not reach the 2010 target and instead will reach approximately 1145 by 2010.

Annual Serious Injuries:	
Target 2010:	1000
2003:	1468
2008:	1218
2009:	1101

Figure 3 – Number of fatalities in South Australia (rolling 12 monthly data)

Note: Each point represents the number of fatalities in the preceding 12 months.

Serious injuries by road user type:

	2009	2004-2008	Difference
Drivers	548	655	-107
Passengers	241	314	-73
Motorcyclists	168	171	-3
Cyclists	59	62	-3
Pedestrians	81	109	-28
Motorised wheelchair	4	1	+3
Total	1101	1312	-211

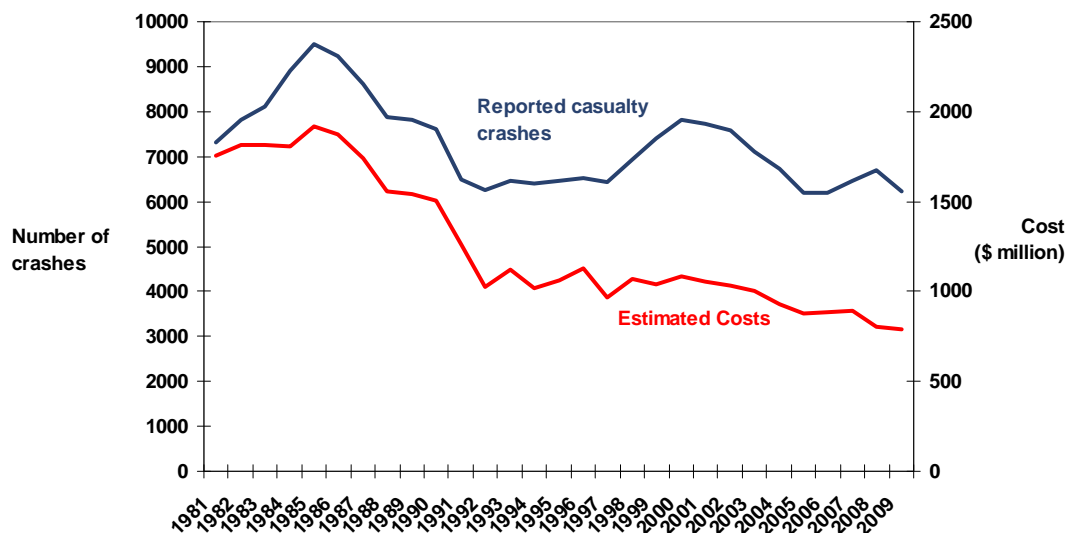

Cost of crashes

Crashes reported to Police

Road crashes in South Australia cost the state over \$1 billion per year, the majority of the cost attributed to serious injury crashes. Even a relatively small reduction in crash numbers would result in considerable savings to the economy.

The following graph shows the number of casualty crashes (including those that result in minor injury) since 1981. In a 25 year period the costs of crashes have decreased considerably. While crashes increased and then decreased between 1997 and 2005, the relative crash costs stayed steady over the same period. This is mainly because crash numbers varied, in particular an increase in minor crashes, however the accompanying decrease in fatal crashes made a considerable impact on total cost.

Figure 4 – Reported casualty crashes and estimated costs, 1981-2009

These crash costs are based on the Bureau of Transport Economic report released in 2000 and indexed using CPI. The costs are estimated based on 'human costs' and include lost labour in the work place, household and community, quality of life, ambulance, hospital and medical care, vehicle and other associated costs.

Cost of crashes

Claims made to the Motor Accident Commission (MAC)

The Motor Accident Commission is responsible for the administration of South Australia's Compulsory Third Party (CTP) insurance scheme. This scheme provides cover to people injured in road crashes. There are differences with the Police statistics on crashes, largely because a driver fully responsible for a crash cannot make a claim for his or her injuries, and some claims arise from crashes not reported to Police.

As can be seen in figure 5, claim numbers have reduced substantially since 2003. Some of this reduction is associated with claims management practices, but some is associated with an improvement in the road safety situation.

Figure 5 – Number of claims lodged with MAC, 1996-2009²

In contrast to this downward trend in claim numbers, claim payments have risen from around \$196 million in 2004/05 to \$337 million in 2008/09. Inflation with the payout for the average claim has overwhelmed the reduction in claim numbers.

Approximately 45% of CTP costs arise from fatality and serious injury crashes. Minor injury crashes account for the remaining costs.

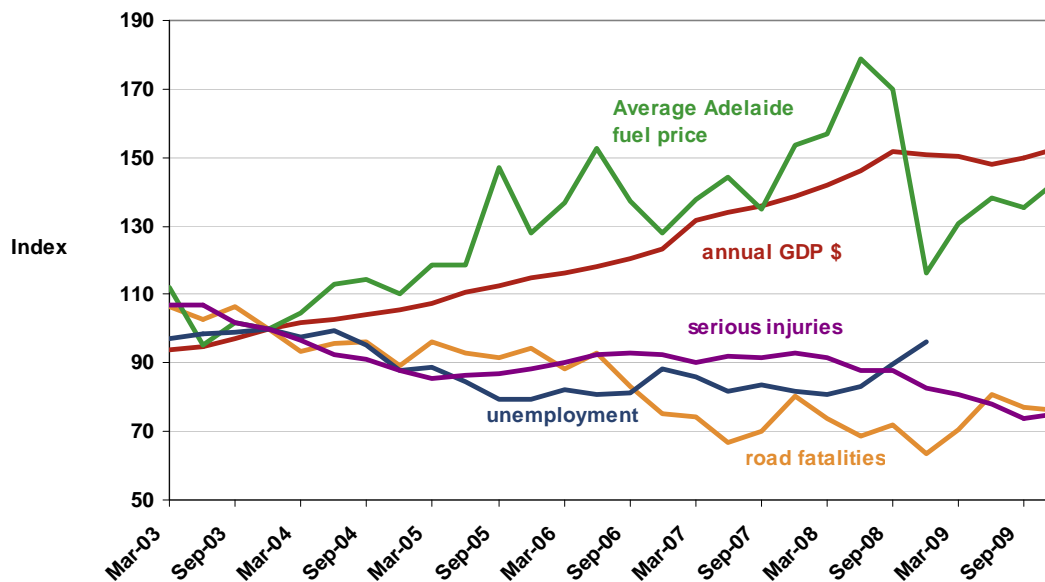

² All CTP data and information is supplied by the Motor Accident Commission

Travel, economic and crash casualty indicators

In these charts, quarterly indicators relevant to road safety are indexed to a common fixed point (December 2003) to directly compare the various trends.

Figure 6 shows from June 2006 annual fatalities fell steeply until June 2007 and then once again declined over 2008. In 2009 fatalities have increased. The average Adelaide fuel price rose dramatically from September 2007 but had a notable drop in the December 2008 quarter. Since the start of 2009 the price has been on the rise again. Unemployment rose slightly in late 2008 while serious injuries have decreased slightly in the later half of 2008 and have continued to do so in 2009.

Figure 6 – Economic indicators and road toll³ (Indexed to December 2003=100)

³ Annual GDP data is from the Australian Bureau of Statistics Table 3. Expenditure on Gross Domestic Product (GDP), Current Prices, Cat No. 5206.0 Australian National Accounts: National Income, Expenditure and Product, Commonwealth of Australia, 2008.

Average Fuel Price Adelaide is sourced from the Australian Automobile Association

Unemployment data is from the Australian Bureau of Statistics Table 7. Labour force status by Sex – South Australia – Trend, Seasonally adjusted and Original, Cat No. 6202.0.55.001 Labour Force, Australia, 2008 (data is not available yet for 2009)

Travel, economic and crash casualty indicators

Figure 7 shows that new motorcycle registrations have grown steadily over time, but have fallen in 2009. New truck registrations declined for the first quarter of 2009 and then increased again for the second quarter. Figure 8 shows that the number of motorcyclists seriously injured have shown some decline in 2009 and then increased again in the last quarter.

Figure 7 – Annual new vehicle registrations⁴ (Indexed to December 2003=100)

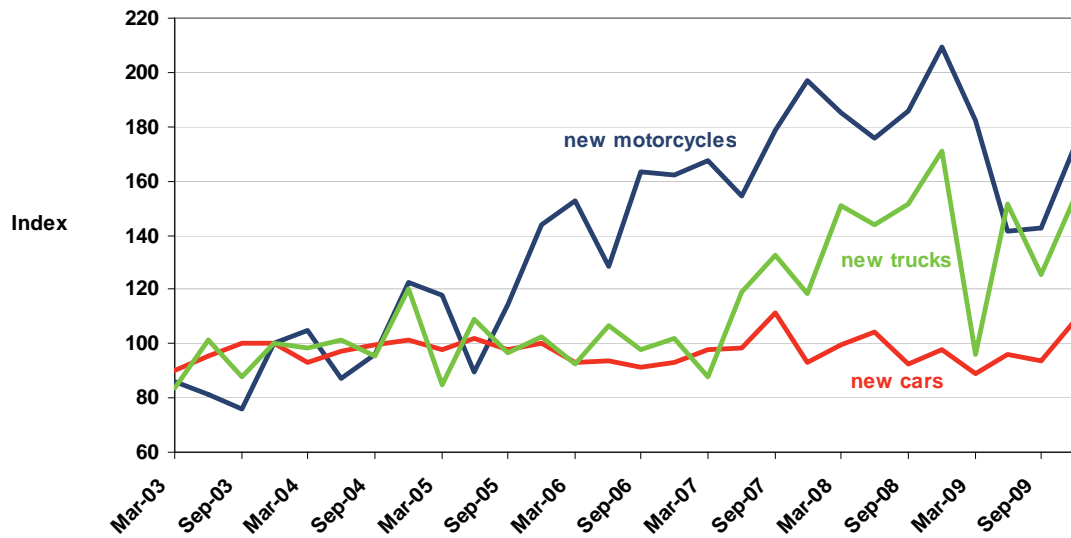

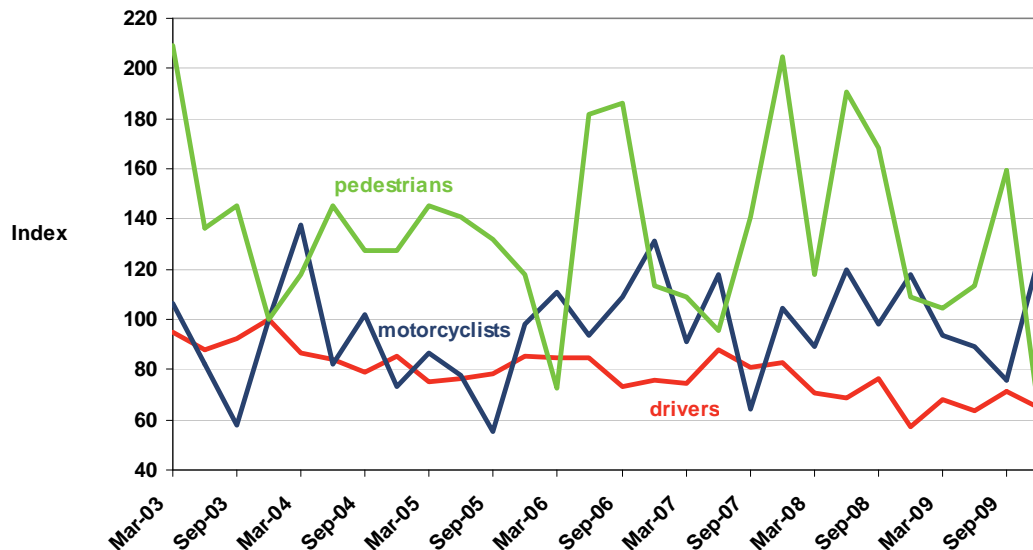

Figure 8 – Serious casualties by road user type⁵ (Indexed to December 2003=100)

⁴ New vehicle registrations are supplied by Safety Regulation Division, DTEI, 2008
 New cars includes cars, station wagons and panel vans
 New trucks includes trucks, prime movers, other commercial and commercial trailers >2.5T

⁵ Please note that in Figure 8 'motorcyclist' does not include pillion passengers

Serious casualty crashes

Crashes on AusLink and DTEI roads

Nearly 20% of all road travel in South Australia is on AusLink roads and 58% is on DTEI roads. DTEI and AusLink roads together account for nearly 72% of all fatal crashes and 60% of serious injury crashes.

Figure 9 – Number of fatal and serious crashes by road type

There was a general decline in the number of serious casualty crashes on DTEI roads from March to September 2009. The crashes on AusLink roads have shown a slight decrease in the last half of 2009.

Top 5 crash types

There were 1008 crashes resulting in serious injury or death reported in the 12 months to December 2009. Crash movement patterns remain fairly constant over time with police reporting crash types such as hit fixed object, right angle, hit pedestrian and vehicle rollover crashes to be the most common serious crash types in the State. The five leading collision types for crashes resulting in death or serious injury for metro and rural areas for the 12 months to the end of December 2009 were:

Metropolitan Adelaide		Rural SA	
131	Hit fixed object crashes	199	Hit fixed object crashes
77	Right angle crashes	117	Vehicle rollover crashes
68	Hit pedestrian crashes	47	Right angle crashes
68	Right turn crashes	28	Head on crashes
59	Rear end crashes	17	Hit pedestrian

Serious casualty crashes

Intersection and midblock crashes

In the 12 months to December 2009, there were 347 serious casualty crashes at intersections and 673 serious casualty crashes on midblock sections (those sections of road where there are no intersecting roads). On average 57% of midblock crashes occur on rural roads, while the majority of intersection crashes (71%) occur on metropolitan roads.

Since 2003 while midblock crashes have had a slight decrease, intersection crashes have remained steady. Both have shown a decrease during 2009 with a jump in the last quarter of 2009.

Figure 10 – Number of fatal and serious injury crashes at intersections and midblock sections per quarter

Crashes by speed limit

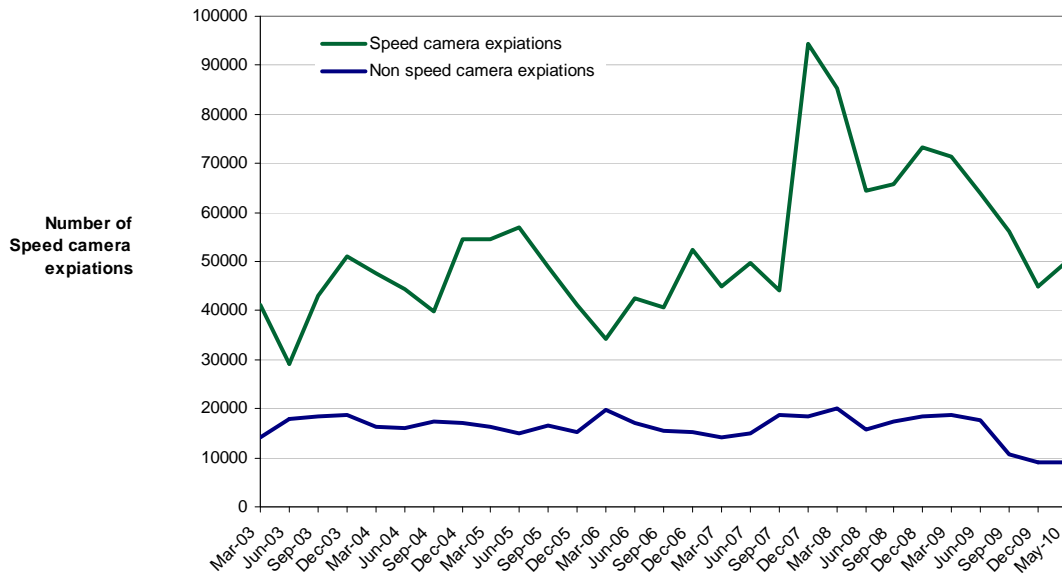

In the 12 months to December 2009 there have been 210 serious casualty crashes on 50km/h roads, 296 crashes on 60km/h roads, 162 crashes on 100km/h roads and 175 crashes on 110km/h roads. Crashes resulting in death or serious injury for metro and rural areas by speed limit for the 12 months to the end of December 2009:

Speed limit of road	Metropolitan Adelaide		Rural SA	
	2009	5 year average 2004-08	2009	5 year average 2004-08
Below 50km/h	8	15	5	7
50km/h	144	170	66	76
60km/h	258	318	38	43
70, 80 or 90km/h	90	90	61	62
100km/h	26	24	136	171
110km/h	1	5	174	175

Speed enforcement

Figure 11 – Number of expiations issued for speed camera and non speed camera enforcement per quarter, 2003-10⁶

(Speed cameras include mobile cameras and static safety cameras. Non speed camera enforcement includes car mounted mobile radar, hand held laser/radar devices or police vehicle speedometer).

The 50km/h default urban speed limit was introduced in March 2003. Since then the number of speed expiations from non speed camera enforcement such as hand held laser devices have averaged nearly 17,000 expiations per year, while speed camera expiations have fluctuated. Speed camera expiations include mobile cameras and static speed/red light traffic safety cameras at intersections. Static traffic safety cameras have been in operation since December 2003. The obvious decrease in speed camera expiations in late 2005 is due to a low number of non-fixed speed camera detection hours for that quarter. There was a sharp increase in the number speed camera expiations in late 2007. One of the contributing factors to this rise is the increase in the number of non-fixed speed cameras used for speed enforcement. Since the March 2008 quarter speed camera expiations have declined.

⁶ Enforcement data supplied by Traffic Intelligence Section, South Australian Police

⁷ Blood alcohol concentration for fatalities is supplied directly from Forensic Science SA

⁸ Please note that these figures are preliminary and may change with future updates

Alcohol and drugs

The proportion of driver and rider fatalities with an illegal blood alcohol concentration has been on the increase in recent years to reach levels similar to that of nearly 25 years ago. In 1981, 44 percent of all drivers and riders killed in road crashes had a BAC of 0.05 or greater. Over time this has decreased to a low of 22 percent in 1998. Since then the incidence of drink driving amongst drivers and riders killed has generally increased. On average 20% of the drivers and riders seriously injured that are tested for blood alcohol concentration have a BAC of 0.05 or above.

In 2009, 27 of the 73 drivers or riders killed (or 37%) who were tested for BAC had an illegal limit of 0.05 or above⁷. A further 88 of the 441 drivers and riders tested (or 20%) who were hospitalised recorded a BAC over 0.05⁸.

On average 23% of driver and rider fatalities that have been tested for the presence of cannabis, methamphetamine or ecstasy, test positive to one or a combination of these drugs. In 2009, 17 of the 73 drivers or riders killed (or 23%) who were tested had the presence of one or a combination of these drugs^{9,10}.

Figure 12 and 13 show enforcement operations and effectiveness of Driver Screening Tests (previously called random breath testing) by South Australia Police. The data includes both static and mobile Driver Screening Tests (DST).

Mobile DST (alcohol) was introduced in June 2003 for 'prescribed periods' such as long weekends and school holidays. In June 2005, this was extended to full time mobile DST, where detections by mobile DST increased. Expiations for both static and mobile DST peaked in the first quarter of 2006. There has been a second peak of positive tests from mobile DST in late 2007, a reflection of an increase in testing over this period. Figure 13 shows another rise in positive tests from both static and mobile DST in December 2008, once again a reflection of the increase in the number of tests conducted at this time as shown in Figure 12.

⁷ Blood alcohol concentration for fatalities is supplied directly from Forensic Science SA

⁸ Please note that these figures are preliminary and may change with future updates

⁹ Drug results for fatalities is supplied directly from Forensic Science SA

Driver Behaviour

Figure 12 – Number of Driver Screening Tests conducted per quarter 2003-2010¹¹

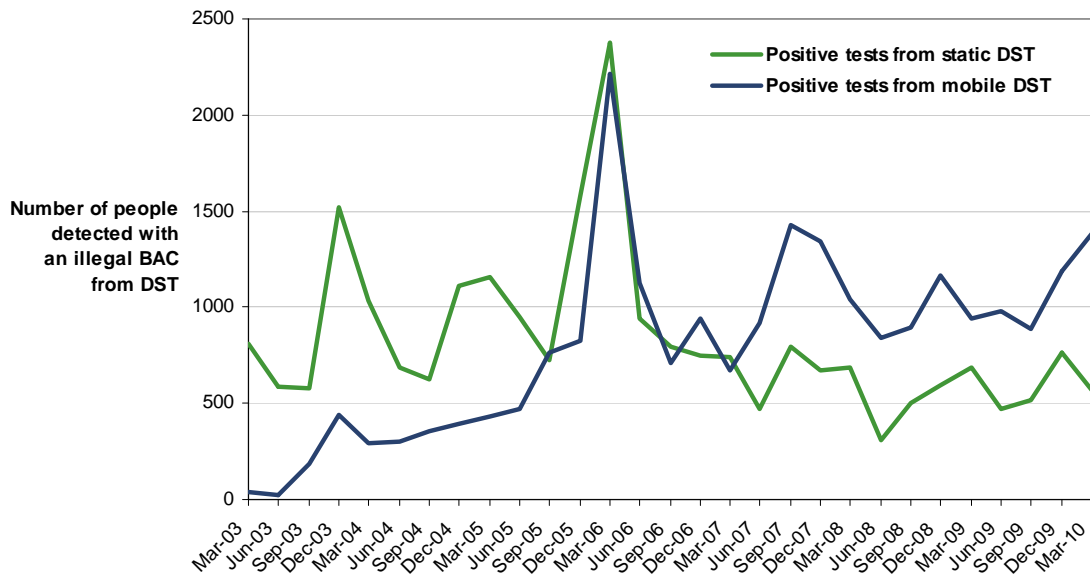

Figure 13 – Number of expiations by static and mobile DST per quarter, 2003-2010¹²

¹¹ Enforcement data supplied by the Traffic Intelligence Section, South Australia Police

¹² Enforcement data supplied by the Traffic Intelligence Section, South Australia Police

Driver Behaviour

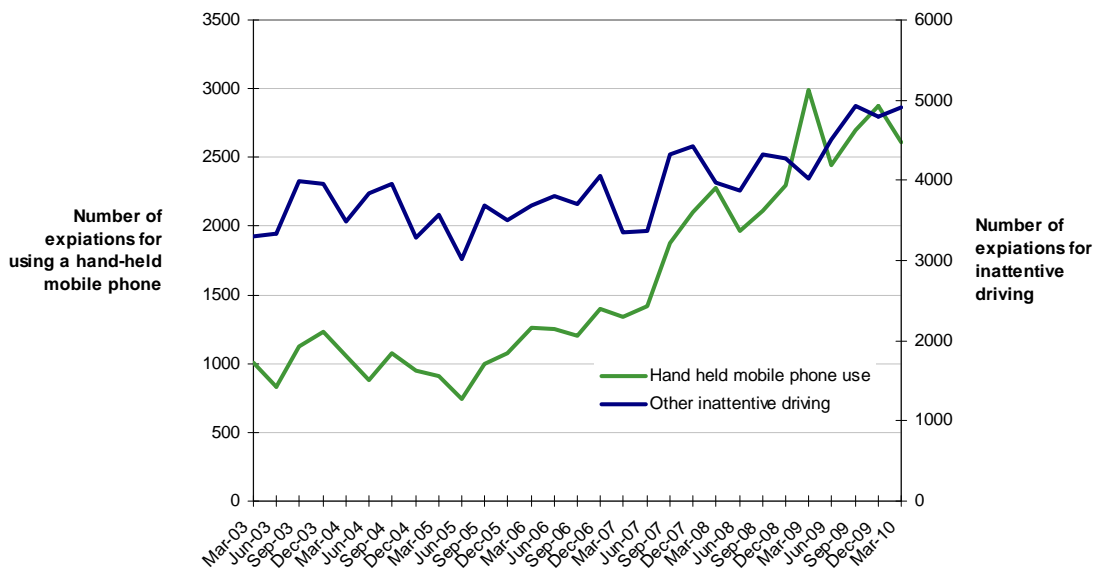

Inattention

Driving is a complex task, requiring drivers to use and coordinate a number of skills. Any lapse in concentration increases the risk of the vehicle being involved in a crash.

In 2009, inattention was reported as a contributing cause of 54% of fatal crashes and 47% of serious injury crashes.

There are over 160 different offences related to inattentive driving. One of the most common inattentive driving offences is using a hand held mobile phone. The number of expiations for hand held mobile phone use and all other inattentive driving offences are shown in figure 14. There has been an obvious increase in the number of expiations given for hand held mobile phone use since 2005. Expiations for using a hand-held mobile phone and other inattentive driving has had a sharp rise since late 2007. The increase in expiations for using a hand held mobile phone has had a large influence on the number of expiations for inattentive driving since 2007. The variation in inattentive driving offences over time could be due to differences in the incidence of inattentive driving or to varying enforcement activity by police.

Figure 14 – Number of expiations for inattentive driving offences per quarter, 2003-2010¹³

¹³ Enforcement data supplied by the Traffic Intelligence Section, South Australia Police

Driver Behaviour

The 2009 National Community Attitudes to Road Safety Survey¹⁴ showed that 92% of South Australian drivers had a mobile phone and 61% reported that they used a mobile phone while driving. This is a significant increase from the 2006 Community Attitudes Survey where 42% of South Australian drivers admitted to using a mobile phone while driving.

Unlicensed or disqualified drivers

Of all drivers and riders who were responsible for fatal crashes for the 12 months to March 2010, 73% had at least one previous driving offence in the last 5 years. The majority of offence types included speeding and driving under the influence (DUI).

From those responsible over the same period, 44% had previously had their licence disqualified on at least one occasion, and 15% of the drivers responsible did not hold a licence at the time of the crash.

Unrestrained vehicle occupants

In the 12 months to December 2009, 25 people killed and 52 people seriously injured were not wearing seatbelts.

On average 36% of all drivers and passengers killed and 10% of vehicle occupants seriously injured are not wearing a seatbelt at the time of the crash.

Intoxicated drivers involved in fatal crashes are less likely than sober drivers to be wearing a seatbelt at the time of the crash. On average 58% of drivers killed who had a BAC of 0.05 or above were not wearing a seatbelt at the time of the crash, compared to 20% of sober drivers.

The proportion of people aged 15 years and over that always wears a seat belt when travelling in the front seat of a car has remained steady (97% in 2009) at between 95% and 97% since 1993¹⁵.

Figure 15 shows the total number of restraint expiation notices given per quarter. There are seven different types of restraint-related offences. The driver of the vehicle is held legally responsible for four of the offences. Consistently the most common restraint offence involved the driver failing to wear a seatbelt adjusted and fastened properly.

¹⁴ Community Attitudes to Road Safety: 2009 survey report, Social Research Centre, Department of Infrastructure, Transport, Regional Development and Local Government, December 2009.

¹⁵ Community Attitudes to Road Safety: 2009 survey report, Social Research Centre, Department of Infrastructure, Transport, Regional Development and Local Government, December 2009

Figure 15 –Number of expiations for restraint use offences per quarter 2003-2009¹⁶

There was a peak of seatbelt expiations in the March 2008 quarter. This coincided with SAPOLs 'Operation Belt Up' targeting seatbelt offence. Another rise can be seen in December 2009

New seatbelt legislation was introduced on 1 March 2008. Drivers are responsible for ensuring that their adult passengers aged 16 and over, are properly restrained in the same way they are responsible for passengers aged less than 16 years.

The variation in the number of restraint-related offences recorded over time could be due to differences in wearing rates or to varying enforcement activity by police.

¹⁶ Enforcement data supplied by the Traffic Intelligence Section , South Australia Police

Children

Four children aged up to 15 years were killed and 59 were seriously injured in road crashes for the 12 months to the end of December 2009. This is two fewer fatalities and 8 fewer serious injuries than the average for the 5 years 2004-2008.

The serious casualties for the 12 months to December 2009 included 4 drivers, 46 passengers, 1 pillion passenger, 3 cyclists and 9 pedestrians. Eight of the vehicle occupant casualties were not wearing a seatbelt or child restraint at the time of the crash. One of the cyclists was not wearing a helmet.

Younger road users

For the 12 months to the end of December 2009, 42 people aged 16-24 years were killed in road crashes and 275 people were seriously injured. The majority were vehicle occupants, 22 driver fatalities and 146 drivers seriously injured, 16 passenger fatalities and 65 passengers seriously injured. In addition there were 2 motorcycle rider fatalities, 32 motorcycle riders seriously injured, 3 pillion passengers seriously injured, 11 cyclists seriously injured, 2 pedestrians killed and 18 pedestrians seriously injured in this younger age group.

The over involvement of young drivers in road crashes continues to be a serious road safety problem. In South Australia young people aged 16 to 24 make up 13% of the population but account for 27% of fatalities and 28% of serious injuries each year. Young drivers in particular have significantly higher risk of death relative to the number of kilometres driven compared to other age groups.

Figure 16 – Number of 16-24 year old serious casualties per month 2004-2009

Older road users

In the 12 months to December 2009, 12 people aged 70 years or over were killed in road crashes and 93 people were seriously injured.

Deaths and serious injury among older road users aged 70 or over have decreased over the last 10 years despite an increase in their population.

The serious casualties for the 12 months to December 2009 included 68 drivers, 20 passengers, 5 motorcyclists, 1 cyclist, 8 pedestrians and 3 motorised wheelchair operators. Three of the vehicle occupant casualties were not wearing a seatbelt at the time of the crash.

Older people generally suffer more serious injury when involved in a road crash because of their fragility. In the same crash circumstances, a 75 year old is four times more likely to be seriously injured than a younger person, or suffer minor injuries when a younger person may have remained uninjured.

Motorcyclists

Serious crashes involving motorcycles were relatively low between 1997 and 2001, but have been increasing since 2002 while other road user trauma has generally decreased. On average 45% of serious motorcycle crashes are 'motorcycle only' crashes and do not involve another vehicle.

In the 12 months to December 2009 there were 15 motorcycle fatalities and 155 motorcyclists seriously injured (including pillion passengers). The number of fatalities and serious injuries is similar to the 2008 totals. Over half of the serious crashes reported were in metropolitan Adelaide.

Cyclists and Pedestrians

In the 12 months to December 2009 there was 2 cyclist deaths and 59 cyclists reported as seriously injured. Over the same period there have also been 9 pedestrian fatalities and 81 pedestrians seriously injured.

There are approximately 3 cyclists killed and 62 injured per year. On average, most cycling injuries occur in the metropolitan area (76%), with around 9% of cyclists killed or seriously injured reported as not wearing a helmet at the time of the collision. A recent survey in the City of Adelaide reported that 99% of cyclists were wearing helmets.

Road Users

Over the last 5 years nearly 1 in every 10 road deaths in South Australia was a pedestrian. The 9 pedestrian fatalities recorded in the 12 months to December 2009 is three fewer than the reported total in 2008 and the 5 year average 2004-08.

On average 36% of pedestrian fatalities are found to have a blood alcohol concentration above the legal driving limit of 0.05. Over half of those that had been alcohol-affected were found to have had a blood alcohol concentration more than 4 times the legal driving limit.

Heavy vehicles

Heavy vehicles travel more than 1 billion kilometres per year in SA. Although they make up around 3% of vehicles registered in SA, heavy vehicles represent 8% of the kilometres travelled in the State.

In the 12 months to December 2009, 13 fatal crashes and 63 serious injury crashes were reported as involving a heavy vehicle. The heavy vehicle driver was deemed to be responsible in 47% of these serious crashes. Since 2003, serious crashes involving trucks have averaged around 25 crashes per quarter. The lowest number of serious casualty crashes involving heavy vehicles occurred in the 2009 September quarter, with just 12 crashes, 3 fatal and 9 resulting in serious injury.

Figure 17 - Number of serious casualty crashes per quarter that involved a heavy vehicle, 2003-2009

Local Government Areas

The following table shows the number of fatal and serious crashes in each local government area in South Australia for the 12 months January 2009 to December 2009.

Metropolitan Adelaide Council areas	Fatal	Serious	Total
